The result of the present test(s) only concerns the tested object(s). The reports signed electronically on digital support are considered an original document, as well as the electronic copies of the same. Their printing on paper has no legal validity (1) ENSATEC, S.L.U., declines all responsibility for the information provided by the client.

## 1 SCOPE

The purpose of this report is to determine the thermal transmittance of the following elements:

- **Glazed sidelight** referenced by the customer as: **Side light frame 77 mm**, and
- **Glazed sidelight** referenced by the customer as: **Side light frame 57 mm**

by the numerical method described in the UNE-EN ISO 10077-1:2020 standard.

The simulation uses the BISCO software version 12, developed by the company Physibel, based on the two-dimensional finite element method for calculating heat transfer. This software has been validated in accordance with the specifications of the UNE-EN ISO 10077-2:2020 standard.

## 2 SAMPLE DESCRIPTION PROVIDED BY THE CLIENT

Description:	GLAZED SIDELIGHT
Reference <sup>(1)</sup> :	SIDE LIGHT FRAME 77 MM
	SIDE LIGHT FRAME 57 MM

Material <sup>(1)</sup> :	PVC
---------------------------	-----

The technical specifications of the test sample have been provided by the applicant and delivered to the laboratory under reference MV76242

The dimensions of the calculated elements are 2100 mm x 500 mm (Height x Width)

## 3 PROCEDIMIENTO DE CÁLCULO

The UNE-EN ISO 10077-1:2020 standard establishes that the thermal transmittance of the door is calculated using the following expression:

$$U_D = \frac{\sum A_g \cdot U_g + \sum A_p \cdot U_p + \sum A_f \cdot U_f + \sum l_g \cdot \Psi_g + \sum l_p \cdot \Psi_p}{\sum A_g + \sum A_f + \sum A_p}$$

$U_D$	Thermal transmittance of the door
$U_g$	Thermal transmittance of glazing
$U_f$	Thermal transmittance of frame
$U_p$	Thermal transmittance of opaque panel
$\Psi_g$	Linear thermal transmittance due to the combined thermal effects of infill, glazing and frame
$\Psi_p$	Linear thermal transmittance due to the combined thermal effects of the panel and frame
$A_g$	Area of glazing
$A_f$	Projected area of frame
$A_p$	Area of opaque panel
$l_g$	Total visible perimeter of glazing
$l_p$	Total visible perimeter of opaque panel

The values corresponding to the heat transmission coefficients of the frames  $U_f$  has been calculated numerically according to UNE-EN ISO 10077-2:2020. These calculations are shown in section 5 of this report.

The value of  $U_g$  has been estimated by the laboratory according to EN 634 and the description of the insulating glass unit, provided by the petitioner.

- Total thickness of IGU: 28 mm
- Composition 4 mm Low e glass/ 8 mm spacer+Argon/4 mm clear float glass/8 mm spacer+Argon/4mm clear glass
- $U_g$  Value = 0.92 W/m<sup>2</sup>K

Linear thermal transmission coefficient  $\Psi_g$  It takes into account combined thermal effects of glazing, spacer and frame, provided by the applicant, in the THERMOBAR spacer data sheet.  
See annex 8 for the technical data sheets of the materials provided by the applicant.

Linear thermal transmission coefficient  $\Psi_p$  can be considered zero as the requirements of section 6.3.2.5. of UNE-EN ISO 10077-1:2020 are fulfilled.

#### 4 BOUNDARY CONDITIONS AND MATERIAL PARAMETERS.

The boundary conditions used for the calculation are those described in Annex E of UNE-EN ISO 10077-2:2020.

Position	Exterior Rse (m <sup>2</sup> K/W)	Interior Rsi (m <sup>2</sup> K/W)
<b>Normal (flat surface)</b>	0.04	0.13
<b>Radiation/Reduced convection (edges or joints between surfaces)</b>	0.04	0.20

Reference temperature conditions are 20°C inside and 0°C outside.

The emissivity shall be taken as 0,9 in all cavities.

Thickness of simulated glass, 28 mm

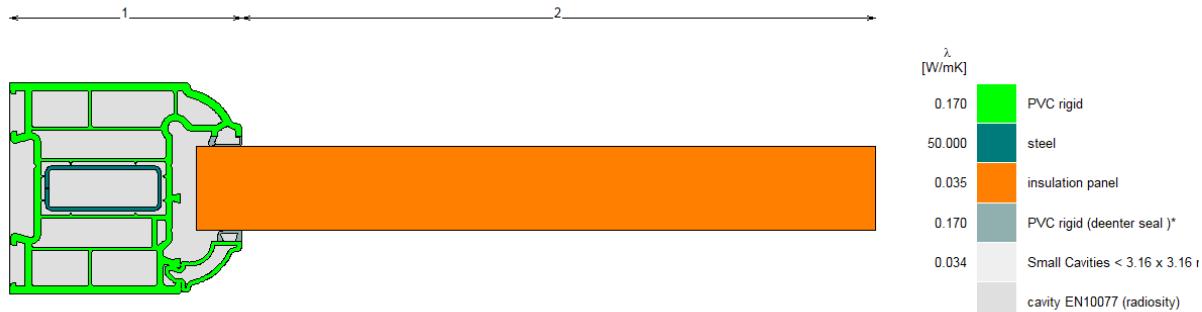

The calculation method used was the RADIOSITY

The thermal conductivity values of the materials used in the calculation are taken from the UNE-EN ISO 10456:2012 Standard "Building materials and products. Hygrothermal properties. Tabulated design values", except those marked with (\*) which have been provided by the applicant.

## 5 CALCULATION OF THE THERMAL TRANSMITTANCE OF THE ELEMENTS

### 5.1 Thermal transmittance Frame 77

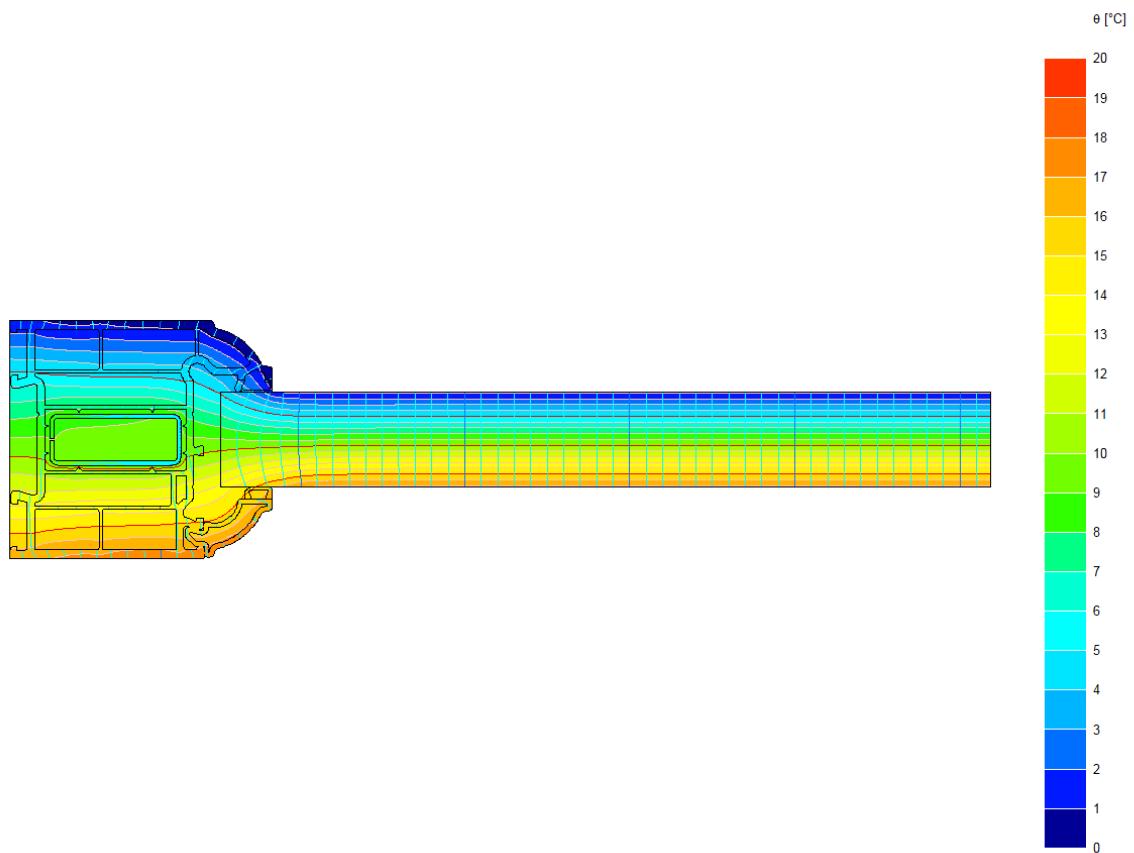

#### Boundary conditions

The boundary conditions are represented below

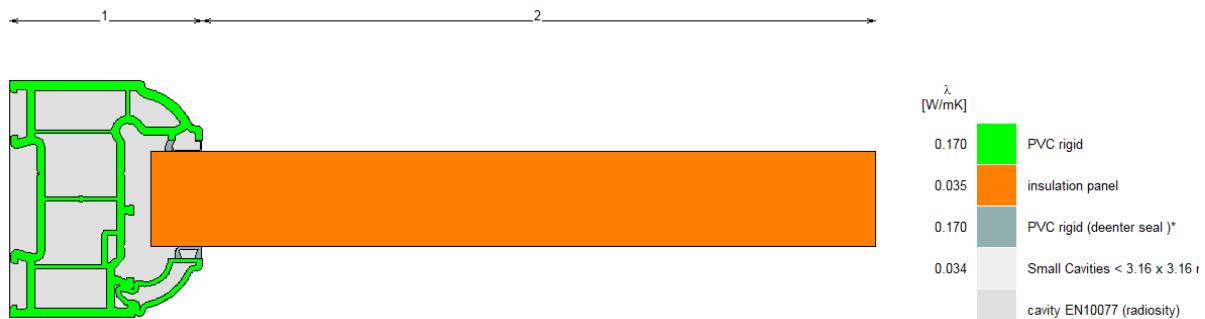

Total Heat Flow (Q)	6,186	W/m
Panel length ( $l_{p1}$ )	0,2110	m
Frame lenght ( $l_f$ )	0,077	m
Thermal transmittance Panel ( $U_{p1}$ )	1,031	W/m <sup>2</sup> K
<b>Thermal transmittance (Uf)</b>	<b>1,191</b>	<b>W/m<sup>2</sup>K</b>

$$U_f = \frac{\left( \frac{Q}{t_i - t_e} \right) - U_{p1} \cdot l_{p1}}{l_f}$$

**Isotherms and heat flux graph**

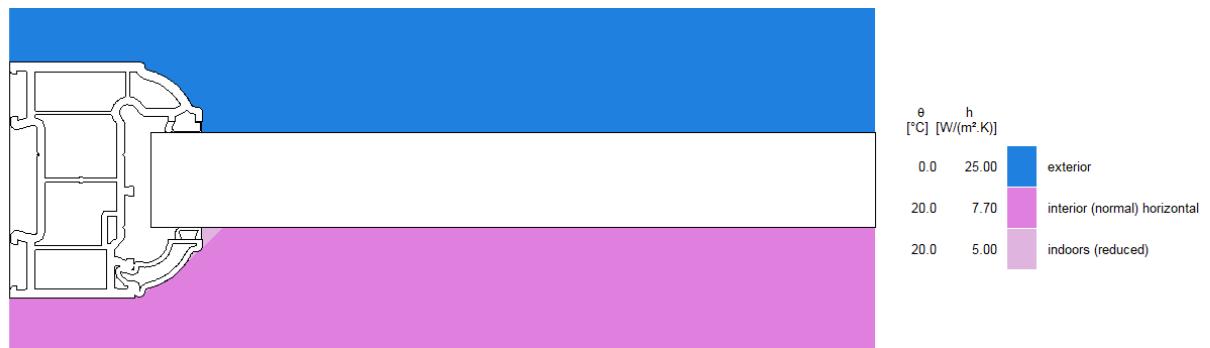

## 5.2 Thermal transmittance Frame 57

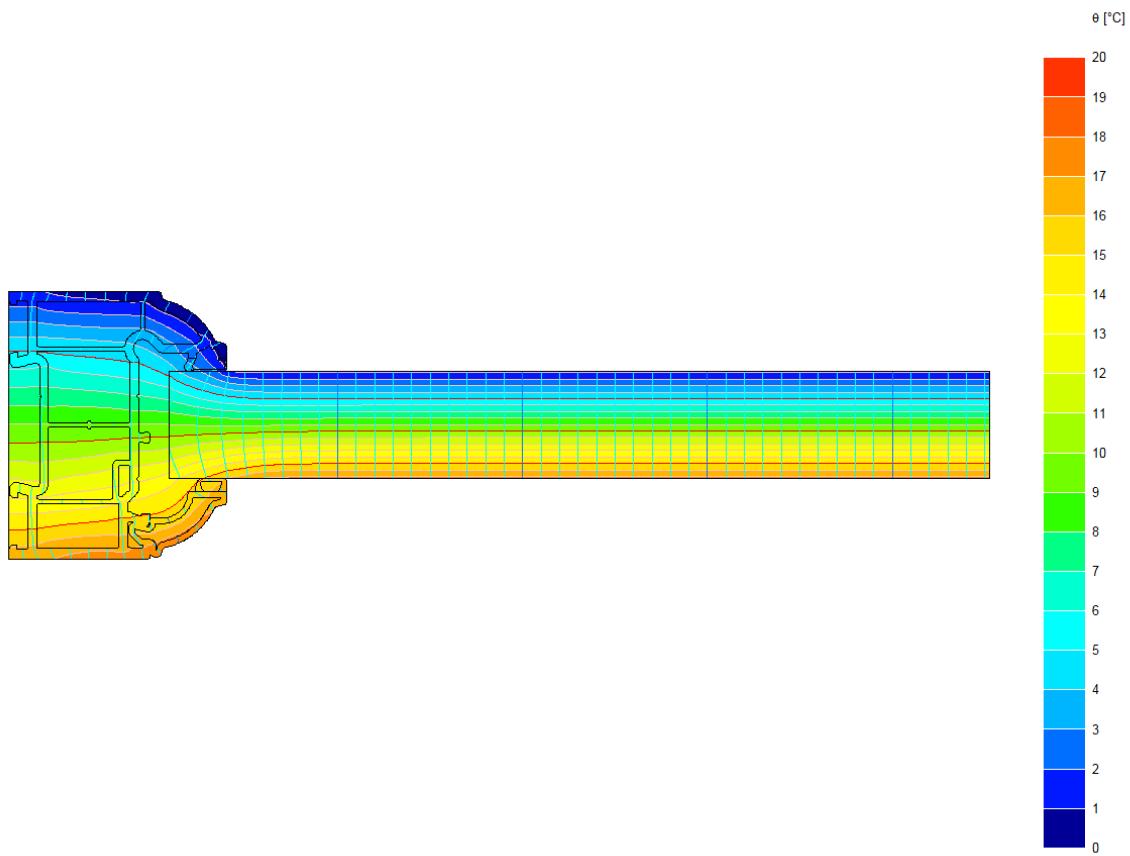

### Boundary conditions

The boundary conditions are represented below

Total Heat Flow (Q)	5,525	W/m
Panel length ( $l_{p1}$ )	0,200	m
Frame lenght ( $l_f$ )	0,057	m
Thermal transmittance Panel ( $U_{p1}$ )	1,031	W/m <sup>2</sup> K
<b>Thermal transmittance (Uf)</b>	<b>1,227</b>	<b>W/m<sup>2</sup>K</b>

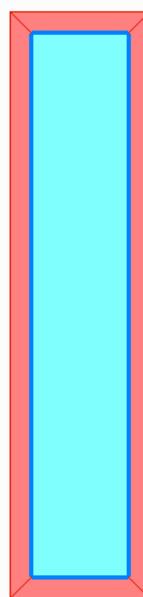

$$U_f = \frac{\left( \frac{Q}{t_i - t_e} \right) - U_{p1} \cdot l_{p1}}{l_f}$$

**Isotherms and heat flux graph**

## 6 CALCULATION OF THERMAL TRANSMITTANCE OF THE SIDELIGHT

### 6.1 Sidelight 77

Width	500	mm
Height	2100	mm
Total Area	1.0500	m <sup>2</sup>
U*A total	1.0681	W/K
ψ*L total	0.1375	W/K
Transmittance U <sub>D</sub>	1.1482	W/m <sup>2</sup> K

The expanded uncertainty for the calculation of thermal transmittance is less than 5%

NOTE: The uncertainty has been calculated taking into account what is indicated in the EN UNE-EN ISO 10077-2:2020 standard.

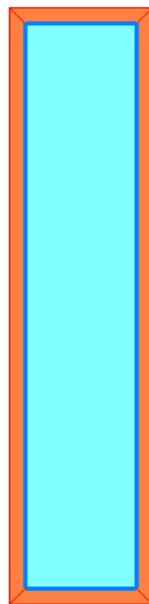

The individual values for each element are shown below:

Reference	color	U [W/m <sup>2</sup> K]	Width [mm]	Height [mm]	A [m <sup>2</sup> ]	U*A [W/K]
glazing	light blue	0,92	346	1946	0,67332	0,6195
frame_77	red	1,191	500	77	0,03257	0,0388
frame_77	red	1,191	77	2100	0,15577	0,1855
frame_77	red	1,191	77	2100	0,15577	0,1855
frame_77	red	1,191	500	77	0,03257	0,0388

ψ material	color	ψ [W/mK]	Total length L [mm]	ψ*L [W/K]
thermobar	blue	0,030	4584	0.1375

## 6.2 Sidelight 77

Width	500 mm
Height	2100 mm
Total Area	1.0500 m <sup>2</sup>
U*A total	1.0513 W/K
Ψ*L total	0.1423 W/K
Transmittance U <sub>D</sub>	1.1368 W/m <sup>2</sup> K

The expanded uncertainty for the calculation of thermal transmittance is less than 5%

NOTE: The uncertainty has been calculated taking into account what is indicated in the EN UNE-EN ISO 10077-2:2020 standard.

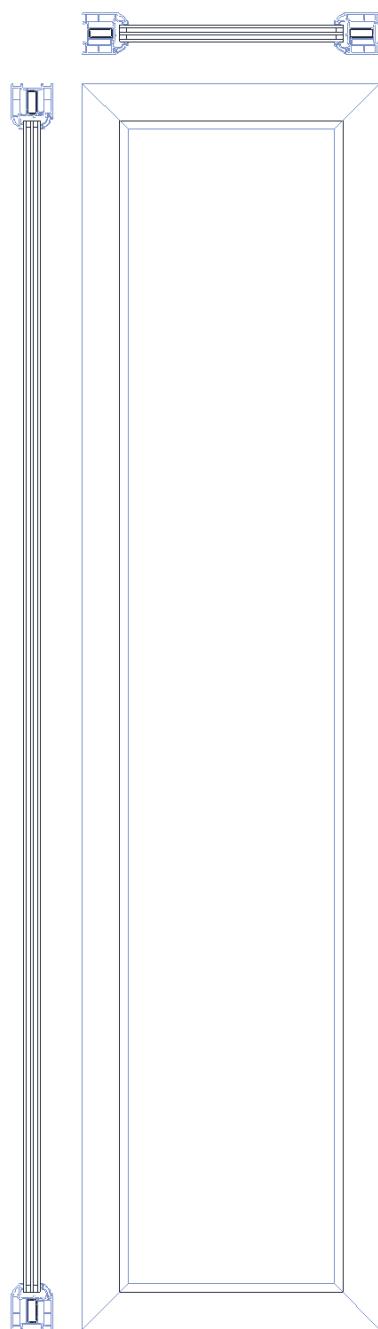

The individual values for each element are shown below:

Reference	color	U [W/m <sup>2</sup> K]	Width [mm]	Height [mm]	A [m <sup>2</sup> ]	U*A [W/K]
glazing	light blue	0,92	386	1986	0,7666	0,7053
frame_77	orange	1,2210	500	57	0,02525	0,0308
frame_77	orange	1,2210	57	2100	0,11645	0,1422
frame_77	orange	1,2210	57	2100	0,11645	0,1422
frame_77	orange	1,2210	500	57	0,02525	0,0308

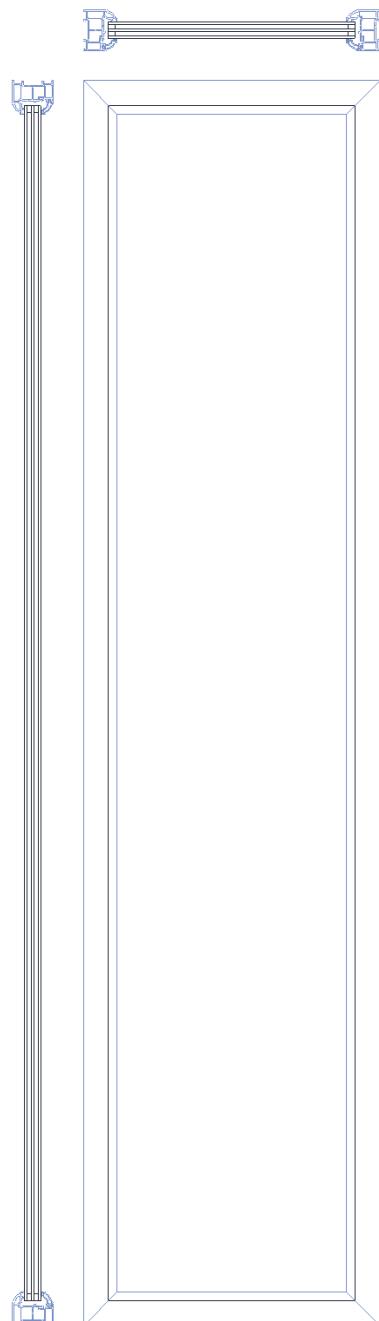

Ψ material	color	Ψ [W/mK]	Total length L [mm]	Ψ*L [W/K]
thermobar	blue	0,030	4584	0,1423

Frame 55

## 8 DOCUMENTATION PROVIDED BY THE CUSTOMER <sup>(1)</sup>

**phA**  
advanced component

The Thermobar™ range is the result of 40 years of dedication to insulated glass.

- SAVE energy with Lowest Conductivity Spacers - **0.14W/mK**
- SAVE energy with lowest Psi values
- SAVE energy with reduced overall window U-values
- SAVE costs on the best futureproof window components

	Plastic window frame	Wood window frame
Double Glazing	0.032	0.031
Triple Glazing	0.030	0.029

Lower Psi values available with Hot Melt.

## TECHNICAL DATA SHEET

PVC 58° Shore A

M 5018

**58° Shore A**

- Density: 1.16g/cm<sup>3</sup>
- Pull strength: 11 Mpa
- Tear stretch: 440 %
- Tear force: 31 N/mm<sup>2</sup>
- Pressure deformation rest: 20% (24h/23°C)
- Pressure deformation rest: 60% (24h/23°C)

**ISO 868**

- ISO 1183-1
- ISO 527
- ISO 527
- ISO 34-B
- ISO 815
- ISO 815

**Working Temperature:**

- -10° to +55° C

**Physical Characteristics**

- Color stability
- Ozone Resistant N/A

**Paint Compatibility:**

The material used in DEVENTER M is **NOT** compatible with thinned acrylic paints and alkyd resin paints containing conventional solvents. Paint and coatings, of which the properties are unknown must be tested for compatibility in contact with the weather seals.

**Available colours:**
